	Urgent	Not Urgent
Important	DO - Your MVP (V1.0)	SCHEDULE - Future Features (V2.0+)
	1. Allow users to manually enter songs with their title, artist, BPM, and genre. 2. Store and manage the entered songs in a collection. 3. Develop an algorithm that orders songs based on BPM differences and genre compatibility. 4. Display one continuous, organized setlist containing all entered songs. 5. Save the generated setlist as a .txt file	1. Import song collections from CSV files. 2. Include musical key and energy levels for more accurate transitions. 3. Export generated setlists as CSV 4. Allow users to manually rearrange songs within a generated setlist. 5.Develop a web-based interface using Java, Spring Boot, HTML, and CSS.
Not Important	DELEGATE - Use Existing Tools	DELETE - Cut Completely
	1. Use Java's Scanner class to handle user input instead of building a custom input system. 2. Use Java's ArrayList to store and manage the song collection. 3. Use Java's built-in sorting utilities and Comparator to assist with song ordering.	1. Build a mobile application for iOS or Android. 2. Include live music streaming or audio playback. 3. Add social networking features such as following DJs or sharing profiles. 4. Develop AI-powered automatic DJ mixing and audio effects.
